Error Propagation

Paul G. Plöger

Outline

Error Types: input, method, roundoff, trunction, modeling, machine Numeric impression in formulas μ and σ for linear case μ and σ in non-linear case (Physical) Errors in digital cameras Parallax What is a "point", how is it mapped?

Input, method, roundoff, truncation, modeling, machine + human errors

Input error:

Given numbers are no machine numbers (e.g. sqrt(2))

While running (method error)

accumulate round off errors per calculation

Truncation error

Systematic errors when stopping an approximation too early

Modeling error

Too strong idealizations

Machine + Human

Hardware errors, programming errors

Some rules for measurements

Rule for Stating Uncertainties:

(Measured value of x) = $x_{best} \pm \delta x$

Experimental uncertainties should almost always be rounded to one significant figure

 x_{best} = best estimate for x δx = uncertainty or error in the measurement

Rule for Stating Answers:

Fractional uncertainty:

The last significant figure in any stated answer should usually be of the same order of magnitude (in the same decimal position) as the uncertainty.

$$=\delta x / |x_{\text{best}}|$$

Approximate correspondence between significant figures and fractional uncertainties.

Number of significant figures	Corresponding fractional uncertainty is	
	between	or roughly
1	10% and 100%	50%
2	1% and 10%	5%
3	0.1% and 1%	0.5%

Uncertainty in Experiements

Counting Experiment:

The uncertainty in any counted number of random events, as an estimate of the true average number, is the square root of the counted number.

(average numer of events in time T)= $v \pm \sqrt{v}$

Example: 14 births in 2 weeks =>

(average births in a two-week period) = 14 ± 4

Uncertainties: ",+","-","*","/"

Sums and diffs:

If
$$q = x + \cdots + z - (u + \cdots + w)$$
, then

$$dq \stackrel{\text{i.}}{\uparrow} a) = \sqrt{(dx)^2 + (dy)^2 \Box (dw)^2}$$

$$dq \stackrel{\text{i.}}{\uparrow} b) \stackrel{\text{f.}}{\vdash} dx + dy \Box + dw$$

Case a):

Independend and random

Case b):

always

Products and Quotients:

if
$$q = \frac{x \times y \times \bot \times z}{u \times v \times \bot \times w}$$
, dx , dy , \Box , dw uncertainties

$$\frac{\partial q}{\partial x} = \sqrt{\left(\frac{\partial x}{x}\right)^2 + \left(\frac{\partial y}{y}\right)^2 \Box + \left(\frac{\partial w}{w}\right)^2}$$

$$\frac{\partial q}{\partial x} = \sqrt{\left(\frac{\partial x}{x}\right)^2 + \left(\frac{\partial y}{y}\right)^2 \Box + \left(\frac{\partial w}{w}\right)^2}$$

$$\frac{\partial x}{\partial x} + \frac{\partial y}{\partial y} \Box + \frac{\partial w}{\partial w}$$

Uncertainties, special cases

If q = Bx, where B is known exactly, then $q = |B| \delta x$.

If q is a function of one variable, q(x), then $\delta q = |dq/dx| \delta x$

If q is a power, $q = x^n$, then $\delta q/|q| = |n| \delta x/|x|$.

Differential Error Analysis

input data: $x \in IR^m$, output $y \in IR^n$, algorithm y = f(x).

Let D_x be the vector of absolute data error in x and

$$JAC(j') := \begin{pmatrix} \frac{\partial j_1}{\partial x_1} & \cdots & \frac{\partial j_1}{\partial x_m} \\ \vdots & \ddots & \vdots \\ \frac{\partial j_n}{\partial x_1} & \cdots & \frac{\partial j_n}{\partial x_m} \end{pmatrix} \in IR^{n \times m}$$

Then for the absolut output error it holds (to first order):

$$D_{v} \doteq JAC(j)D_{x}$$

if we calculate in absence of round off errros.

Example curvature Radius R

$$R(v_r, v_l) = \frac{d}{2} \frac{v_r + v_l}{v_r - v_l}$$

$$\frac{\partial R}{\partial v_r} = \frac{d}{2} \left[\frac{1(v_r - v_l) - (v_r + v_l)1}{(v_r - v_l)^2} \right] = -d \frac{v_l}{(v_r - v_l)^2}$$

$$\frac{\partial R}{\partial v_l} = \frac{d}{2} \left[\frac{1(v_r - v_l) + (v_r + v_l)1}{(v_r - v_l)^2} \right] = -d \frac{v_r}{(v_r - v_l)^2}$$

$$DR = -d \left[\frac{v_l}{(v_r - v_l)^2} Dv_r + \frac{v_r}{(v_r - v_l)^2} Dv_l \right]$$

When $v_1 \approx v_r$ then R is very imprecise Input errors in v₁ and v_r are grossly amplified

E[] for linear maps

Linear case, y is a linear map of x:

$$\vec{y} = F(\vec{x}) = A\vec{x} + \vec{b} \bowtie$$

$$E[\vec{y}] = E[A\vec{x} + \vec{b}]$$

$$= \grave{0}\grave{0}\grave{0} \square \grave{0} (A\vec{x} + \vec{b})p(x_1, x_2, \square, x_n)dx_1dx_2 \square dx_n \quad take \ component \ j:$$

$$E[y_j] = \grave{0}\grave{0}\grave{0} \square \grave{0} \grave{c} \overset{\circ}{\underset{i}{\circ}} a_{ij}x_i \overset{\circ}{\underset{i}{\circ}} p(x_1, x_2, \square, x_n)dx_1dx_2 \square dx_n +$$

$$\grave{0}\grave{0}\grave{0} \square \grave{0} b_j p(x_1, x_2, \square, x_n)dx_1dx_2 \square dx_n$$

$$= \overset{\circ}{\underset{i}{\circ}} a_{ij} \grave{0}\grave{0} \grave{0} \square \grave{0} x_i p(x_1, x_2, \square, x_n)dx_1dx_2 \square dx_n + b_j$$

$$= \overset{\circ}{\underset{i}{\circ}} a_{ij} E[x_i] + b_j \bowtie E[\vec{y}] = AE[\vec{x}] + \vec{b}$$

Covariances for linear case

cov(y)

$$= E[((A\vec{x} + \vec{b}) - (AE[\vec{x}] + \vec{b})) ((A\vec{x} + \vec{b}) - (AE[\vec{x}] + \vec{b}))^{T}]$$

$$= E[(A\vec{x} - AE[\vec{x}])(A\vec{x} - AE[\vec{x}])^{T}]$$

$$= E[A(\vec{x} - E[\vec{x}])(\vec{x} - E[\vec{x}])^{T}A^{T}]$$

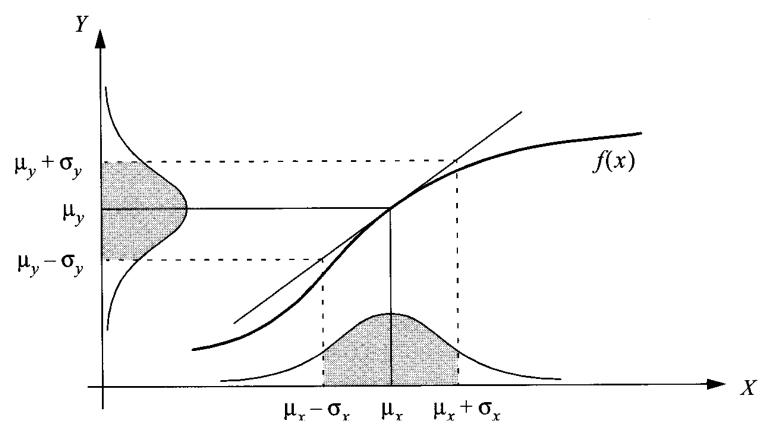

$$= A \operatorname{cov}(x)A^{T}$$

Bonn-Rhein-Sieg

How Uncertainties get mapped

Use Taylor expansion

μ and cov nonlinear

$$\vec{u} = F(\vec{x}) (via \ Taylor) \triangleright E[\vec{u}] = F(E[\vec{x}])$$

$$\operatorname{cov}(\vec{u}) = JAC(F)\big|_{\vec{x}} \operatorname{cov}(\vec{x}) JAC(F)\big|_{\vec{x}}^{T}$$

where JAC(F) is the Jacobian of the map F

Example Covariance

assume: Laser scanner measures polar coordinates (d, α), measument of d and α independend normally distributed d $\sim N(\mu_d, \sigma_d^2)$, $\alpha \sim N(\mu_\alpha, \sigma_\alpha^2)$, they have to be mapped to cartesian (x,y) via:

 $F([d,\alpha]^T) = [d \cos(\alpha), d \sin(\alpha)]^T.$

How does the original covariance matrix change?

Solution Covariance

Jacobian:

$$\nabla F = \begin{pmatrix} \cos(\alpha) & -d\sin(\alpha) \\ \sin(\alpha) & d\cos(\alpha) \end{pmatrix}$$

$$F \mid \alpha \rangle = \begin{cases} d\sin(\alpha) \\ Expected \ value : \end{cases}$$

$$\operatorname{cov}\begin{pmatrix} x \\ y \end{pmatrix} = \nabla F \operatorname{cov}\begin{pmatrix} d \\ \alpha \end{pmatrix} \nabla F^{T} =$$

Mapping:

$$F\begin{pmatrix} d \\ \alpha \end{pmatrix} = \begin{pmatrix} d\cos(\alpha) \\ d\sin(\alpha) \end{pmatrix} =: \begin{pmatrix} x \\ y \end{pmatrix}$$

$$covariance \\ cov(\begin{pmatrix} x \\ y \end{pmatrix}) = \nabla F cov(\begin{pmatrix} d \\ \alpha \end{pmatrix}) \nabla F^{T} = \begin{pmatrix} \mu_{x} \\ \mu_{y} \end{pmatrix} = F\begin{pmatrix} \mu_{d} \\ \mu_{\alpha} \end{pmatrix} = \begin{pmatrix} \mu_{d} cos(\mu_{\alpha}) \\ \mu_{d} sin(\mu_{\alpha}) \end{pmatrix} = \begin{pmatrix} d cos(\alpha) \\ d sin(\alpha) \end{pmatrix}$$

$$\begin{pmatrix} \cos(\alpha) & -d\sin(\alpha) \\ \sin(\alpha) & d\cos(\alpha) \end{pmatrix} \begin{pmatrix} \sigma_d^2 & 0 \\ 0 & \sigma_\alpha^2 \end{pmatrix} \begin{pmatrix} \cos(\alpha) & \sin(\alpha) \\ -d\sin(\alpha) & d\cos(\alpha) \end{pmatrix} =$$

$$\begin{pmatrix}
\sigma_d^2 \cos^2(\alpha) + d^2 \sigma_\alpha^2 \sin^2(\alpha) & (\sigma_d^2 - d^2 \sigma_\alpha^2) \cos(\alpha) \sin(\alpha) \\
(\sigma_d^2 - d^2 \sigma_\alpha^2) \cos(\alpha) \sin(\alpha) & \sigma_d^2 \sin^2(\alpha) + d^2 \sigma_\alpha^2 \cos^2(\alpha)
\end{pmatrix}$$

Covariance in Error Propagation

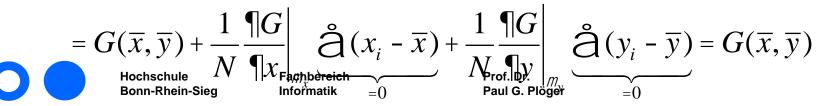

Let F(x,y) be given, let N data pairs given: $(x_1,y_1),(x_2,y_2),...,(x_N,y_N)$.

Then we can compute empirical mean x^{-} , S_{x} , y^{-} and S_{y} as usual.

Assume $x_1,...,x_N$ close to x^- (same for y). Then:

$$G_i = G(x_i, y_i) \gg G(\overline{x}, \overline{y}) + \frac{\P G}{\P x} \bigg|_{m_x} (x_i - \overline{x}) + \frac{\P G}{\P y} \bigg|_{m_y} (y_i - \overline{y})$$

$$\overline{G} = \frac{1}{N} \mathring{a} G_i = \frac{1}{N} \mathring{a} \mathring{c} G(\overline{x}, \overline{y}) + \frac{\P G}{\P x} \Big|_{m_x} (x_i - \overline{x}) + \frac{\P G}{\P y} \Big|_{m_y} (y_i - \overline{y}) \stackrel{\dot{\cdot}}{=} \frac{1}{N} \mathring{a} \mathring{c} G(\overline{x}, \overline{y}) + \frac{1}{N} \mathring{a} \mathring{c} G(\overline{x}, \overline{y}) +$$

Standard deviation for G:

$$S_G^2 = \frac{1}{N} \mathring{a} (G_i - \overline{G})^2$$

$$\Rightarrow \frac{1}{N} \mathring{a} \overset{\text{\tiny de}}{\underset{\text{\tiny de}}{\overleftarrow{G}}} + \frac{\P G}{\P x} \bigg|_{\overline{x}, \overline{y}} (x_i - \overline{x}) + \frac{\P G}{\P y} \bigg|_{\overline{x}, \overline{y}} (y_i - \overline{y}) - \overline{G} \overset{\ddot{0}^2}{\overset{\dot{}}{\overleftarrow{\emptyset}}} =$$

$$= \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (x_{i} - \overline{x})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathcal{X}}{\mathbb{I}} \frac{\mathbb{I}}{\mathbb{I}} \frac{\ddot{0}^{2}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathbb{I}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2}} + \underbrace{\frac{\mathbb{I}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2}} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathbb{I}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2}} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathbb{I}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2}} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\frac{\mathbb{I}}{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2}} \mathring{a} (y_{i} - \overline{y})^{2} + \underbrace{\mathbb{I}} \frac{1}{N} \mathring{a} (y_{i} - \overline{y})^{2} \mathring{a} (y_{i} - \overline{y})$$

$$2\frac{\P G}{\P x}\bigg|_{\overline{x},\overline{y}}\frac{\P G}{\P y}\bigg|_{\overline{x},\overline{y}}\frac{1}{N}\mathring{a}(x_i-\overline{x})(y_i-\overline{y})$$

$$= \underbrace{\mathcal{C}}_{\dot{\mathbf{Q}}}^{\mathbf{q}} \underbrace{\mathbf{G}}_{\mathbf{x}, \overline{y}} \stackrel{\ddot{\mathbf{G}}}{\overset{\dot{\mathbf{G}}}{\otimes}} S_{x}^{2} + \underbrace{\mathcal{C}}_{\dot{\mathbf{Q}}}^{\mathbf{q}} \underbrace{\mathbf{G}}_{\mathbf{x}, \overline{y}} \stackrel{\ddot{\mathbf{G}}}{\overset{\dot{\mathbf{G}}}{\otimes}} S_{y}^{2} + 2 \underbrace{\mathbf{G}}_{\mathbf{y}}^{\mathbf{q}} \underbrace{\mathbf{G}}_{\mathbf{x}, \overline{y}} \underbrace{\mathbf{G}}_{\mathbf{x}, \overline{y}} \underbrace{\mathbf{G}}_{\mathbf{y}}^{\mathbf{q}} \underbrace{\mathbf{G}}_{\mathbf{x}, \overline{y}} \underbrace{\mathbf{G}}_{\mathbf{y}}^{\mathbf{q}} \underbrace{\mathbf{G$$

Hochschule Bonn-Rhein-Sieg Fachbereich Informatik

Prof. Dr. Paul G. Plöger

...cont

S_{xv} is empirical covariance If x ,y independent $S_{xy} \approx 0$ So then it follows:

$$S_G^2 = \mathop{a}\limits_{i} S_{z_i}^2 \mathop{c}\limits_{\dot{e}} \frac{\P G \ddot{0}^2}{\P z_i \ddot{\emptyset}}$$

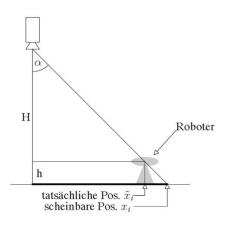

Parallax during Observation

(a) Farbkreise als Trackingmerkmale

(b) Korrektur der Positionsabweichung aufgrund der Perspektive

$$\tilde{x}_i = x_i \left(1 - \frac{h}{H} \right)$$

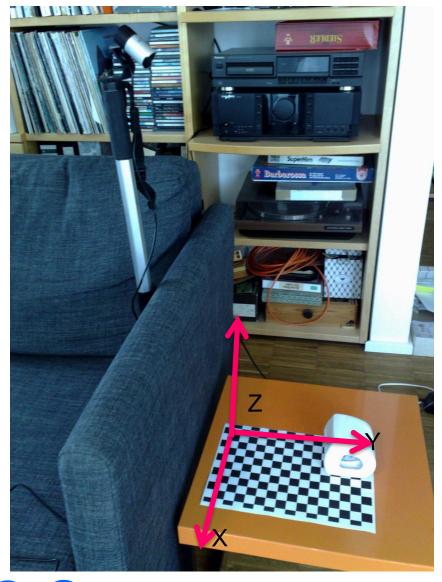

Camera setup

Make sure that the frame used during calibration (and extrinsic parameter finding) is aligned like shown. Provide Rc_1 and TC_1 And the current view of robot by the camera

 $XXc = Rc_1 * XX + Tc_1$

"Point" observations

Like the circles in last image the observered LED is mapped as to many points. Where is the robot?

Q: how about observed points, which are outside depth of field (DOF) and are thus depicted as "circles of confusion" instead of points?
